Q1 What is Figma? Explain its features and why its widely used in modern UI/UX design?

Ans
① Figma is a cloud based UI/UX design tool used to design websites, mobile apps and software interfaces.

→ It works directly in web browsers so no heavy installation is requiered and it runs on any OS.

→ It supports real time collaboration, allowing multiple designs to work on the same file.

→ It provides vector based design tools which helps in creating scalable user interface elements.

→ Figma introduces interactive prototyping, enables designers to create clickable designs and user flow without coding.

→ The component and design feature ensures consistency by resuting UI elements across projects.

→ It offers developer vs handoff features, generating design specs, and code snippets for easy implementation.

→ widely used to save time, improve teamwork and simplify UI/UX

Q2 Differentiate b/w Designing and Prototyping?

| DESIGNING | PROTOTYPING |
| --- | --- |
| → It refers to creating a visual layout of an interface such as colours, fonts, icons, buttons & overall screen structure. | → Prototyping refers to interactions and navigation between designed screens. |
| ② Its main focus is totally | → Focussed upon the UI working and performance and looks. |

upon how UI looks.

→ Designers use frames, shapes, texts and components to build screens

→ It defines branding, consistency and visual hierarchy

→ They define "How will app/website look like!"

Eg Creation of beautiful login screen

→ It uses link buttons, add transitions and simulate user actions with clicks & swipes.

→ It helps user experience and usability before development

→ They define → "How the user will navigate and move across.

Eg Linking of Submit button to Profile page

Q3 What are Components and styles in Figma? How do they help in creating, maintaining consistency and saving time?

Ans COMPONENTS

→ They are reusable UI elements such as buttons / Input feilds, navbar and cards that are reusable

→ The main component acts as a master, and any changes made to it will automatically update all instances, ensuring uniformity.

→ Components help maintain design consistency by using the same UI elements throughout large projects.

→ They significantly save time in the process

STYLES

→ It defines reusable design properties such as colour, font and effects.

→ When a style is updated all elements using that style would be also updated.

→ It ensures branding consistency, especially working on large projects.

→ Together, components and styles make larger project with efficient speed & time and easier to manage as well.

Q4 Explain Auto-Layout in Figma? How does it help in creating responsive design to different screen sizes?

→ Auto Layout is a figma feature that automatically arranges and resizes UI elements based on content, spacing and alignment rules.

→ It allows designer to define padding, spacing between items, direction and alignment within a frame

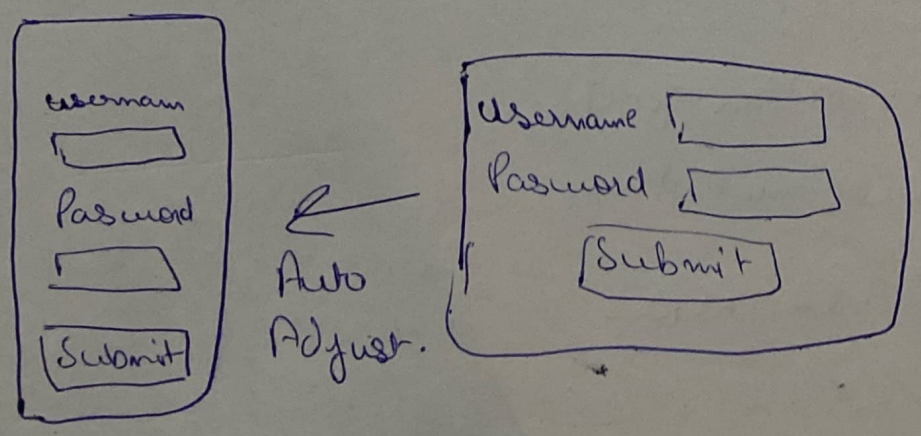
→ When text length or Element size changes. Autolayout adjusts the layout automatically without manual resizing.

→ It helps creating responsive designs by allowing components to stretch, shrink or wrap to screen size.

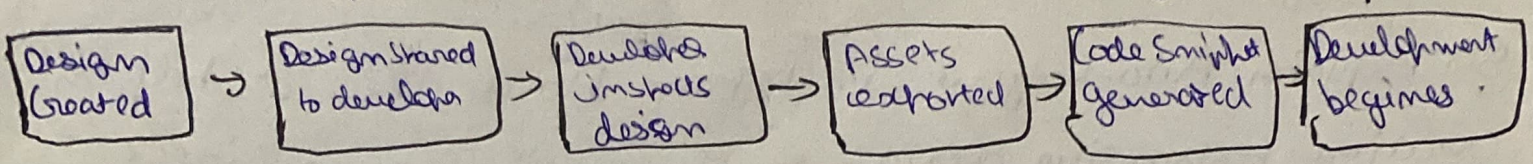
→ Designer can set elements to hug content, fill container or have fixed sizes.

→ It makes it easier to design for multiple screen sizes.

→ It also speeds up iteration and ensures consistent spacing and stretches across UI.



Describe the complete developer handoff process in figma? How are designs shared, assets exported and code snippets generated.



## Developer Handoff:-

-> It is the process of transfering of designs from designer to developer
-> It ensures developer understands layouts styles, assets and interactions
-> Figma provides built in tools to avoid manual documentation.

## Design Sharing:-

-> Designer shares files using view or inspect access.
-> Developer screens prototype and components
-> Real time update ensures everyone sees the latest design

## Asset Exporting:-

-> Images, Icons and illustrations can be exported directly
-> Assets can be downloaded in multiple formats -> PNG, JPEG etc
-> Export settings (size, scale) are pre-defined by designer.

## Code Snippet Generation:->

-> Figma automatically generates code snippets
-> supports web / Android / IOS / PC
-> Developer can copy exact values for colours, fonts etc

## Advantages

-> Reduces communication gap
-> Saves development time
-> Minimize code error.
